AB PURPOSE: To allow the sender to recognize a faulty state of a receiver  
side FAX concretely in details by transiting the polling procedure and  
informing the FAX fault information stored in a memory by a receiver side  
FAX to the sender side FAX when a fault takes place in the receiver side  
FAX during communication and the communication is disabled.  
CONSTITUTION: When the receiver side FAX has a fault and it is  
discriminated by the sender side, the polling procedure is transited  
succeedingly. In the presence of the polling request from the sender side  
FAX, FAX fault information in a RAM 18 is extracted by the control of an  
MPU 10, a ROM 2 is accessed based on the address information to read a  
corresponding picture data. The read picture data is informed to the  
sender side FAX as a message via a transmission/reception section 17.  
Thus, the sender side can recognize what the fault of the receiver side  
FAX is concretely in details.
